00 / PORTFOLIO / 2026

I'm Justin. *A UX Director and strategist* who specializes in leading design, content, and development teams to create user-centered applications and campaigns.

SCROLL

01

ABOUT

My strengths lie in simplifying technical concepts **for clients and collaborating with them to build digital solutions that prioritize user experience.**

Throughout the product lifecycle, I work closely with clients on applications, websites, and campaigns that align with integrated marketing, advertising, public relations, and lead-generation efforts.

My background in web development has allowed me to work within a myriad of platforms that host, distribute, and maintain interactive applications. With over 18 years of client-facing experience in both the private and public sectors, I leverage my expertise to make informed decisions that drive product success and improve outcomes.

02

APPROACH

I believe great experiences are not designed in isolation; they are orchestrated across *people, policy, and platforms.*

01

Translate complexity into clarity

Whether the brief is federal policy, vehicle launch logistics, or an AI-enabled workflow, my job is to find the through-line and make it simple, without flattening what matters.

02

Design with the team, not for them

I lead designers, engineers, researchers, and account leads as a single craft team. Coaching and critique are how quality scales across regions, time zones, and engagement types.

03

Trust as a unit of measurement

Especially in human + AI experiences. I set standards for transparency, accessibility, and responsible design so the resulting product earns its place in someone's day.

03

SELECTED WORK

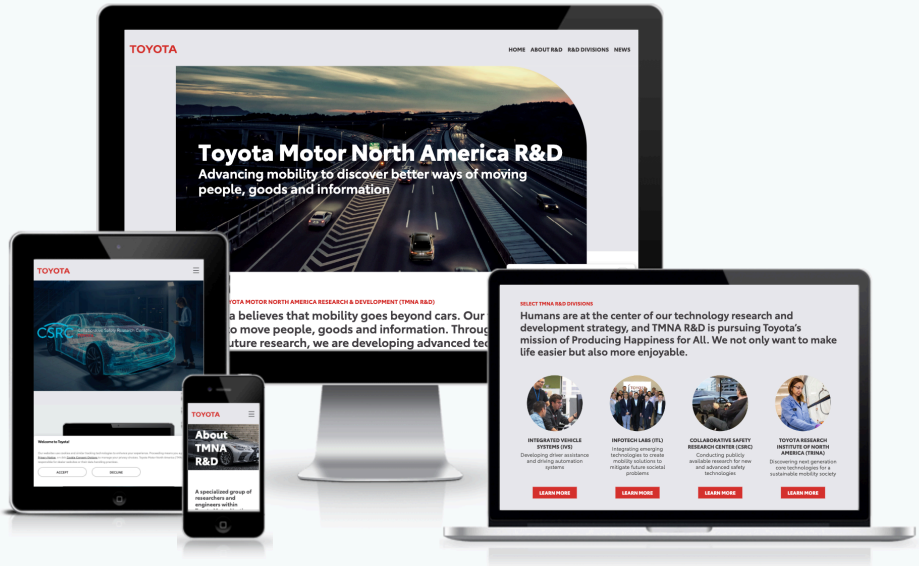
Four engagements illustrating clarity, craft, and measurable outcome.

01 Navigating a Reorg with Toyota's Advanced Mobility R&D

Navigating a Reorg with Toyota's Advanced Mobility R&D

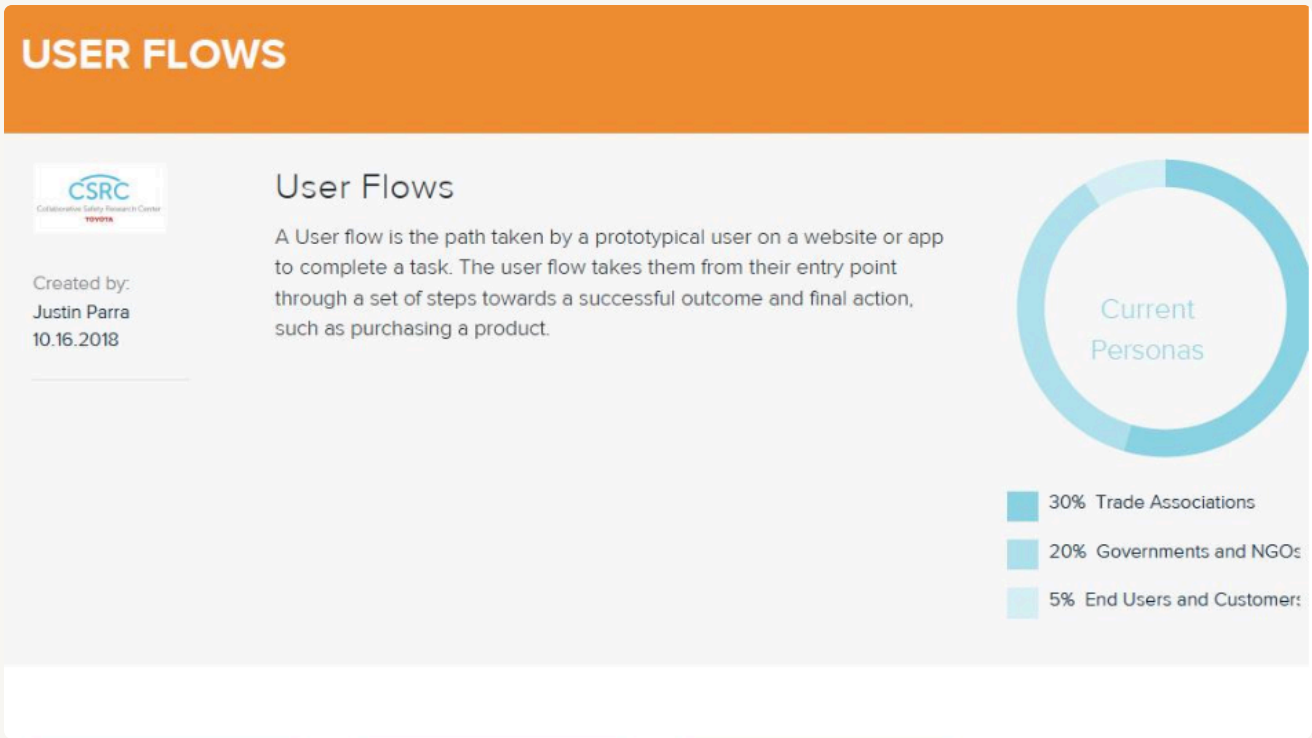
When Toyota needed help presenting their newly consolidated R&D division to the public, our integrated team built an experience that made a complex organization's work digestible to a niche audience.

STAKEHOLDER RESEARCH INFORMATION ARCHITECTURE DESIGN + CMS



Toyota AMRD homepage.

Toyota's AMRD (Advanced Mobility R&D) conducts research and product development for the next 10, 20, and 30 years of automotive technology. Setting the agenda for what mobility looks like decades out.



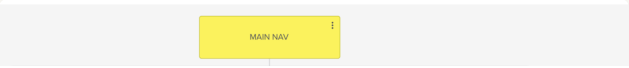
User flows and personas mapping audience segments and navigation paths.

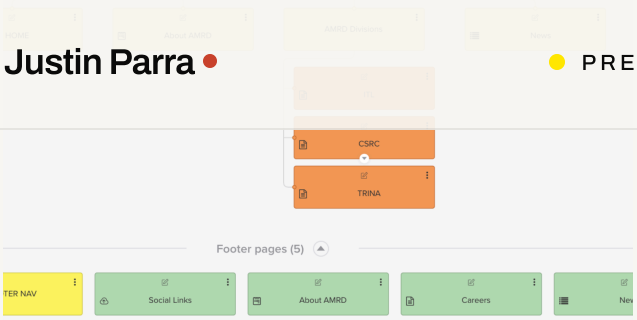
02 / HOW

When Toyota asked us to help them present this newly consolidated department to the public, our integrated team stepped in to make a very complex organization's work digestible to a niche audience.

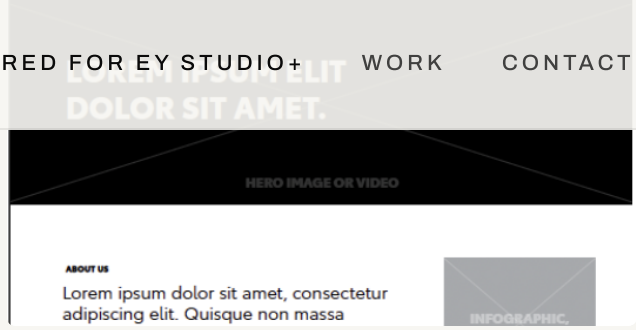
We visited Toyota's AMRD headquarters in Ann Arbor, Michigan to meet their Communications Team, engineering leads, and researchers to understand how the new R&D divisions would actually be organized. Stakeholder interviews surfaced the challenge: appealing primarily to experienced engineers in the talent pool, alongside the journalists who report on AMRD's work.

Using existing user data, past research, and stakeholder feedback, we built user flows, personas, a sitemap, and wireframes that guided our design teams and built mutual buy-in with the client.





Sitemap designed with the client team to organize AMRD's divisions.



Wireframe exploration for the AMRD homepage structure.

03 / RESULTS

Toyota gained a new recruiting and public-engagement tool that can efficiently answer the question, "What's the difference between AMRD's divisions?" Our preliminary SEO work helped the site rank higher for several key search terms tied to advanced mobility research.

04 / MY ROLE

- Built user personas
- Designed the sitemap with the client team
- Conducted stakeholder interviews with Toyota's engineering and communications leaders
- Led our internal team of designers to build out a site audit, wireframes, and responsive mockups
- Directed the dev team to build, test, and deploy the website and CMS

02 AI-Generated Website Audit Framework

AI-Generated Website Audit Framework

An experiment in building a reusable methodology for evaluating website performance, SEO, usability, and content that combines AI-assisted analysis with structured human review.

AI WORKFLOW DESIGN AUDIT METHODOLOGY REPORTING TEMPLATES

Hero — Audit framework reporting view.

01 / WHAT

Website audits of performance, SEO, usability, and content were getting done one engagement at a time, each from scratch. Findings were inconsistent across teams, slow to produce, and rarely connected the technical signals (Core Web Vitals, crawlability) to the experience signals (IA, content quality) in a way clients could actually act on.

Standardized scorecard surfacing performance, SEO, usability, and content signals in one view.

02 / HOW

I built a repeatable audit framework that pairs AI-assisted analysis with a structured human review pass. Lighthouse, accessibility scanners, and content-quality models do the heavy data collection; a templated reporting layer in Figma turns those raw signals into prioritized recommendations clients can hand straight to their dev and content teams.

Each pass produces a consistent scorecard, so improvements can be measured pre/post. The same methodology runs whether the site is a 12-page brochure or a 12,000-page enterprise platform.

03 / RESULTS

Cut audit turnaround from weeks to days. Standardized output across the team so any designer or strategist can run the framework, and findings now feed directly into roadmap prioritization rather than sitting in a slide deck. The framework has become a model for how we introduce AI into client-facing deliverables.

04 / MY ROLE

+ Designed the audit framework and scoring methodology
+ Built the AI-assisted analysis pipeline (performance, accessibility, SEO, content quality)
+ Created Figma reporting templates so the framework is reusable across the team
+ Defined human review checkpoints to keep AI output trustworthy and client-ready
+ Piloted the framework on internal site audits before rolling it out to client work

03 Nordic Global Mergers, Acquisitions, and Rebrands

Nordic Global Mergers, Acquisitions, and Rebrands

Helped Nordic evolve from Nordic Health to Nordic Global while redesigning their digital presence to accommodate new services and products during a landmark year of growth.

Nordic Global homepage and mega menu.

01 / WHAT

Nordic was on a fast-track to evolve from Nordic Health in Wisconsin, to Nordic Global, a worldwide healthcare-efficiency company worth more than a billion dollars.

Our team jumped on board for a fast-paced ride, accommodating new services and products joining the fold as the business grew through a landmark year for the organization.

Revised sitemap organizing Nordic's expanded services and products into intuitive categories.

02 / HOW

Our UX team of designers, developers, and project managers was integrated into the project from day one. Before we layered the new services and products into the new website, we knew there was upstream work to do: consolidating pages and streamlining the user journey.

Our copywriters collaborated with the marketing team to rename navigation labels so the page inventory actually made sense, while we simplified the navigation experience based on user feedback and stakeholder interviews.

The final redesigned Nordic Global homepage with improved navigation and content organization.

We built out several new sitemaps as the company evolved over the year, encompassing their products and services under easy-to-find categories. We also designed a complete overhaul of the Home page and several key inner pages, which improved legibility and the user's likelihood of cross-traversing the site to explore more content.

04 / MY ROLE

- Conducted a card-sorting exercise with the client to start the conversation about content hierarchy and priorities
- Ran multiple live sitemap-building sessions to discuss, design, and revise the sitemap
- Led an internal design team to build out wireframes and multiple Home page mockups
- Directed the client's development team in Brazil to build the new Home page and inner pages
- Led QA and testing via Jira with the development team to finalize the work to spec

04 Accidents de France Three.js & Open Data Visualization

Accidents de France Three.js & Open Data Visualization

A 3D visualization experiment using Three.js, Claude Code, and open French traffic-accident data from data.gouv.fr that explored how immersive views can make public-sector data legible at a glance.

THREE.JS OPEN DATA AI-ASSISTED DEVELOPMENT

3D visualization of French accident data.

01 / WHAT

A self-directed experiment exploring how 3D environments can make public-sector data legible at a glance. The dataset derived from open French traffic-accident records at data.gouv.fr that contained rich geographic, temporal, and severity dimensions that flatten poorly in standard charts.

The question: can a 3D scene let a viewer feel the pattern (where, when, how severe) before they read a single number?

Severity mapped to vertical extrusion; time-of-day mapped to color.

02 / HOW

Built the visualization in Three.js, with Claude Code as a pair-programming collaborator for shader work, geometry generation, and data wrangling. Pulled the raw accident records, geocoded and clustered them, then mapped severity to vertical extrusion and time-of-day to color.

Iterated quickly on camera framing and interaction patterns to find a view that reads as both atlas and analysis tool that oriented non-technical viewers in seconds while still rewarding deeper exploration.

Data pipeline view. Raw open-data records geocoded and clustered before render.

03 / RESULTS

A working prototype that surfaces geographic accident hotspots and temporal patterns instantly. Orienting a view that a public-safety stakeholder could understand in seconds. Just as importantly, it became a working reference for how AI-assisted development (Claude Code) compresses a one person prototyping cycle from weeks to days.

04 / MY ROLE

- Conceived the experiment and chose the dataset
- Designed the 3D visual language consisting of geometry, color mapping, and camera framing
- Built the Three.js scene and data pipeline
- Used Claude Code as a pair-programmer for shader and geometry iteration
- Documented the workflow as a reference for AI-assisted prototyping
